

# PMIP4 SATIRE-M solar forcing data

The files contain Solar Spectral Irradiance (SSI) reconstruction based on **14C** or **10Be** and the SATIRE-M model, with and without an adaptation of the spectral irradiance to the CMIP6 *historical* forcing.

- 14C data for the last 9000 years (6754.5 BC to December 2015)
- 10Be data for the years 885 CE to December 2015
- In both cases, the data is daily, starting on January 1st 1850, and yearly before

The **14C-based data set** scaled to the CMIP6 historical forcing is the **recommended forcing for the PMIP4-CMIP6 tier-1 past1000 experiment**.

## Data files

- file names = SSI\_<type>\_cycle\_yearly\_cmip\_v20160613\_<scaling>.txt
  - type = 14C or 10Be
  - scaling =
    - fc: adaptation of the spectral irradiance to the CMIP6 *historical* forcing
    - nfc: no re-scaling

## Data format

Be careful when working with the time axis, because the *float year values* do not really follow [time axis and calendar conventions](#)!

The original data files are provided in simple text format, and we also provide the data in netCDF format. The text files' structure is as follows:

- 1st array: **wavelength array** in [nm], listing the center of each wavelength bin  
[ 115.5, 116.5, 117.5, 118.5, 119.5, [...] 100000.0078125 , 120000.0234375 , 140000.015625 , 160000.015625 ]
- 2nd array: **wavelength bin** in [nm], listing the bin width of each wavelength bin  
[ 1., 1., 1., 1. [...] 40., 5010., 14990.00488281, 20000.00585938, 20000., 20000., 20000.00585938, 20000.00585938, 20000., 20000. ]
- 3rd array: **time** in [year] (floating numbers)
  - 69235 time steps for 14C: [ -6754.5, -6753.5, -6752.5, -6751.5, [...] 2015.98632812, 2015.98901367, 2015.99182129, 2015.99450684, 2015.99731445 ]
  - 61595 time steps for 10Be: [ 885.5, 886.5, 887.5, 888.5, [...] 2015.986, 2015.989, 2015.992, 2015.995, 2015.997 ]
- 4th array: **SSI reconstruction** in [W m<sup>-2</sup> nm<sup>-1</sup>]. SSI is average SSI in corresponding bin.

We provide the following IDL and python code to read the .txt file and calculate TSI:

- ```

=====
;N=69235 for 14C reconstruction
;N=61595 for 10Be reconstruction
header=strarr(12)
satire_wl=dblarr(1070)
satire_dwl=dblarr(1070)
time=dblarr(N)
SSI=dblarr(1070,N)

openr,1,filename
  readf,1,header
  readf,1,satire_wl
  readf,1,satire_dwl
  readf,1,time
  readf,1,SSI
close,1

TSI=dblarr(N)
FOR i=0L,N-1 DO TSI[i]=TOTAL(satire_dwl*SSI[*,i])
=====

```

- The following python code shows how to deal with the original compressed text data. You can also check the [full python script](#) that was used to generate the netCDF files

- ```

# Get directly the data from the bz2 compressed file
file_in = bz2.BZ2File(input_full_path)

# Print the comments at the beginning of the file
print '\nData file header:'
for skip_header in range(nb_header_lines):
    hdr = file_in.readline().strip()
    print 'HEADER =>', hdr

# Get the wavelength data (on a single line) and store it in a
numpy
# array
wl_str = file_in.readline()
wl = np.array(map(float, wl_str.strip().split()),
dtype=np.float32)

# Get the wavelength bins data (on a single line) and store it in
a
# numpy array
wl_bin_str = file_in.readline()
wl_bin = np.array(map(float, wl_bin_str.strip().split()),
dtype=np.float32)

# Get the years (on a single line) and store them in a numpy array
year_str = file_in.readline()
year = np.array(map(float, year_str.strip().split()),

```

```
1.,
    1., 1.])
>>> ssi_average_weighted = np.average(ssi, axis=0,
weights=time_weights)
```

## Download

Once you have downloaded the compressed text data file, you can use the command bzmores to have a quick look at its content without having to uncompress it!

```
> bzmores
